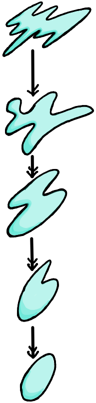
A mystery in 3-dimensions

A mystery in 3-dimensions

In hyperbolic 3-manifolds:

topological complexity of finite covers grows at a rate reflecting geometry



A mystery in 3-dimensions

In hyperbolic 3-manifolds:

topological complexity of finite covers grows at a rate reflecting geometry

Conjecture (Bergeron–Venkatesh)

Let M be a closed, hyperbolic 3-manifold and let

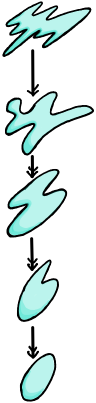
$$M = M_0 \twoheadleftarrow M_1 \twoheadleftarrow M_2 \twoheadleftarrow \cdots$$

be a cofinal tower of finite-sheeted normal covers of M, that is,

$$\bigcap_n \pi_1(M_n) = 1.$$

Then

$$\lim_{n\to\infty} \frac{\log(|\mathrm{Tor}(H_1(M_n;\mathbb{Z}))|)}{[\pi_1(M) : \pi_1(M_n)]} = \frac{\mathrm{vol}(M)}{6\pi}.$$



At the crossroads

At the crossroads

- **Geometry $\leftrightsquigarrow$ Topology:** "Gauss-Bonnet on steroids" –

$$\chi(\Sigma) = \frac{K \cdot \mathrm{Area}(\Sigma)}{2\pi} \qquad (\Sigma \text{ closed, orientable, constant curvature } K).$$

At the crossroads

- **Geometry $\leftrightsquigarrow$ Topology:** "Gauss-Bonnet on steroids" –

$$\chi(\Sigma) = \frac{K \cdot \mathrm{Area}(\Sigma)}{2\pi} \qquad (\Sigma \text{ closed, orientable, constant curvature } K).$$

- **Topology $\leftrightsquigarrow$ Analysis:** Prediction $\mathrm{vol}(M)/6\pi$ obtained using analytic methods on the universal cover $\widetilde{M} \cong \mathbb{H}^3$ of M (L^2-torsion, Lück–Schick '99).

At the crossroads

- **Geometry $\leftrightsquigarrow$ Topology:** "Gauss-Bonnet on steroids" –

$$\chi(\Sigma) = \frac{K \cdot \mathrm{Area}(\Sigma)}{2\pi} \qquad (\Sigma \text{ closed, orientable, constant curvature } K).$$

- **Topology $\leftrightsquigarrow$ Analysis:** Prediction $\mathrm{vol}(M)/6\pi$ obtained using analytic methods on the universal cover $\widetilde{M} \cong \mathbb{H}^3$ of M (L^2-torsion, Lück–Schick '99).

- **Geometry $\leftrightsquigarrow$ Number theory:** **Roughly,** in arithmetic groups, homological torsion parametrizes field extensions $K/\mathbb{Q}$.

At the crossroads

- **Geometry $\leftrightsquigarrow$ Topology:** "Gauss-Bonnet on steroids" –

$$\chi(\Sigma) = \frac{K \cdot \mathrm{Area}(\Sigma)}{2\pi} \qquad (\Sigma \text{ closed, orientable, constant curvature } K).$$

- **Topology $\leftrightsquigarrow$ Analysis:** Prediction $\mathrm{vol}(M)/6\pi$ obtained using analytic methods on the universal cover $\widetilde{M} \cong \mathbb{H}^3$ of M (L^2-torsion, Lück–Schick '99).

- **Geometry $\leftrightsquigarrow$ Number theory:** **Roughly,** in arithmetic groups, homological torsion parametrizes field extensions $K/\mathbb{Q}$.

  BV Conjecture: $\forall p$, $$\lim_{n\to\infty} \frac{\log(|\mathrm{Tor}_p(H_1(M_n;\mathbb{Z}))|)}{[\pi_1(M):\pi_1(M_n)]} = 0,$$

  so torsion must involve larger and larger sporadic primes.

Open problem

Is there a finitely presented residually finite group G, and a residual normal chain

$$G \trianglerighteq G_1 \trianglerighteq G_2 \trianglerighteq \cdots$$

(i.e. $\bigcap_n G_n = \{1\}$), such that

$$\lim_{n\to\infty} \frac{\log(|\mathrm{Tor}(G_n^{\mathrm{ab}})|)}{[G : G_n]} > 0 \ ?$$

Relaxations: examples in every direction

Relaxations: examples in every direction

- **Finite presentation:** (Kar–Kropholler–Nikolov '17) For every $f : \mathbb{N} \longrightarrow \mathbb{N}$ there is a fg G and an exhausting normal chain $G \trianglerighteq G_1 \trianglerighteq G_2 \trianglerighteq \cdots$ such that $|\mathrm{Tor}(G^{\mathrm{ab}})| > f([G : G_n])$.

Relaxations: examples in every direction

Theorem (Sun '15)

Let M be a closed hyperbolic 3-manifold and let A be a finite abelian group. There exists a finite-sheeted cover $\widehat{M} \twoheadrightarrow M$ such that

$$H_1(\widehat{M}; \mathbb{Z}) = A \oplus \cdots .$$

"Abundance of virtual homological torsion"

Similar proof works for all 3-manifolds with empty or toroidal boundary which are not graph manifolds (Chu–Groves '22).

Back to 3-manifolds

Theorem (Sun '15)

Let M be a closed hyperbolic 3-manifold and let A be a finite abelian group. There exists a finite-sheeted cover $\widehat{M} \twoheadrightarrow M$ such that

$$H_1(\widehat{M}; \mathbb{Z}) = A \oplus \cdots .$$

"Abundance of virtual homological torsion"

Similar proof works for all 3-manifolds with empty or toroidal boundary which are not graph manifolds (Chu–Groves '22).

In graph manifolds:

- Solv or Seifert-fibred – restrictions on torsion.
- Non-trivial JSJ – any number can divide $|\mathrm{Tor}(H_1(\widehat{M}; \mathbb{Z}))|$ (F–Hughes–Valiunas).

Homological torsion: Existence

Homological torsion: Existence

Theorem (Ascari-F '25)

Let G be a hyperbolic graph of free groups with $\mathbb{Z}$ edges, which is not a free product of free and surface groups. Then G has abundant virtual homological torsion, that is,

for every finite abelian group A, there is a finite-index subgroup $G_0 \leq G$ such that

$$G_0^{\mathrm{ab}} = A \oplus \cdots .$$

Question (Remeslennikov)

Are finitely generated (non-abelian) free groups profinitely rigid?

Profinite rigidity 201

The largest natural class of groups where Remeslennikov's question has an answer:

Profinite rigidity 201

The largest natural class of groups where Remeslennikov's question has an answer:

Theorem (Wilton, '18)

Free groups are profinitely rigid amongst hyperbolic graphs of free groups with $\mathbb{Z}$ edges.

Profinite rigidity 201

The largest natural class of groups where Remeslennikov's question has an answer:

Theorem (Wilton, '18)

Free groups are profinitely rigid amongst hyperbolic graphs of free groups with $\mathbb{Z}$ edges.

Theorem (Ascari-F '25)

Free products of free and surface groups are profinitely rigid amongst hyperbolic graphs of free groups with $\mathbb{Z}$ edges.

Corollary (For the "Puders", Ascari-F '25)

"Partial surface words" in $F_n = \langle x_1, \dots, x_n \rangle$ are determined by the measures they induce on finite groups:

1. $[x_1, x_2] \cdot [x_3, x_4] \cdots [x_{2k-1}, x_{2k}] \qquad (2k \leq n).$
2. $x_1^2 \cdot x_2^2 \cdots x_k^2 \qquad (k \leq n).$

Growth: non-normal towers

Growth: non-normal towers

Theorem (Ascari-F '25)

There exists a tower of finite-index non-normal subgroups

$$G \geq G_1 \geq G_2 \geq \cdots, \qquad \textit{with} \ \bigcap_n G_n = \{1\},$$

such that simultaneously for every prime p,

$$\lim_{n\to\infty} \frac{\log(|\mathrm{Tor}_p(G_n^{\mathrm{ab}})|)}{[G : G_n]} > 0.$$
